

CLEAN COPY OF THE AMENDMENT

12. A compound represented by the following structural formula:

and physiologically acceptable salts thereof, wherein:

X is a member selected from the group consisting of a hydrophobic aliphatic hydrocarbon chain containing from about 4 to about 30 carbon atoms and having one or more nonconjugated cis double bonds in the middle portion of the chain;

Y is selected from the group consisting of amide and ester radicals; and

Z is selected from the group consisting of hydrogen, lower alkyl, hydroxy substituted lower alkyl, aryl, heterocyclic and hydroxy substituted heterocyclic radicals;

wherein if X contains from 19 to 22 carbon atoms, Z cannot be hydrogen if Y is amide.
